Nagarjuna, an engineering student and a recent [artificial leg above knee](#) amputee gives a personal account of the first day on his new prosthesis... Please watch this video and learn how a young amputee regains confidence before exploring what he can do with a C-leg from Ottobock!

Heinrich Popow won gold in London 2012 para Olympics with Otto Bock prosthesis, which enables an athlete with [above-knee](#) amputation to use the treadmill and take part in sports involving running, long jump, high jump, and javelin.

Carbon fiber technology has so far been used primarily for the particularly active amputees. The Terion makes the proven advantages of carbon material (lightweight, flexible, durable) accessible to users with moderate mobility. The minimalistic design with an anatomically shaped elastic heel and a partially split carbon fiber spring support the user with high dynamics and energy return in a broad spectrum of everyday situations.

The Terion is suitable for prosthesis users with Below's knee, Knee disarticulation, [Above-knee](#), or Hip disarticulation amputations who want to take part in everyday work and leisure activities.
